Section:  
**Introduction**

# Clustering Introduction

- **Clustering** belongs to the category of **unsupervised learning**
- A clustering algorithm tries to **find structure** in the data
- Once the clusters are found, they first have to be interpreted...
- ...and can then be used for prediction purposes

A cluster should be **internally homogeneous**, but simultaneously **externally heterogeneous**. (Elements of one cluster should be similar to each other, but should differ significantly from elements belonging to other clusters.)

# Example Use Cases for Clustering

- **Behavioral segmentation**
  - Customer segmentation (e. g. [sinus milieus](#))
  - Creating profiles based on activity monitoring
- **Sorting sensor measurements**
  - Image grouping
  - Detection of activity types in motion sensors
- **Inventory categorization**
  - Grouping inventory by sales activity
  - Grouping inventory by manufacturing metrics
- Many, many more, ...

# Clustering Strategies

- ① **EM-based clustering**, e. g.: *k*-Means
- ② **Hierarchical clustering**, e. g.:
  - Agglomerative clustering
  - Divisive clustering
- ③ **Affinity-based clustering**, e. g.:
  - Spectral clustering
  - DBSCAN

Section:  
*k*-Means

# k-Means: Procedure

- The algorithm is an instance of **vector quantization**
  - It represents data points by a single vector (**centroid**) which is close to them
  - This is useful for **data compression**!
- **How to:** Create  $k$  partitions ( $\hat{=}$  clusters) of the data set  $\mathcal{D}$ , such that the sum of squared deviations from the cluster centroids is **minimal**:

$$\min_{\mu_j} \sum_{j=1}^k \sum_{\mathbf{x}^{(i)} \in \mathcal{D}_j} \|\mathbf{x}^{(i)} - \mu_j\|^2 \quad (1)$$

- Where  $\mathcal{D}_j \equiv j$ -th cluster,  $\mu_j \equiv$  centroid of  $j$ -th cluster

## Result: Voronoi Diagram

- The dots represent cluster centroids
- The lines visualize the **cluster boundaries**
- For a new point we can easily determine to which cluster it has to be assigned

# k-Means Algorithm

- Input:  $\mathcal{D} = \{\mathbf{x}^{(1)}, \mathbf{x}^{(2)}, \dots, \mathbf{x}^{(n)}\} \in \mathbb{R}^{n \times m}$ , number of clusters  $k$
- Algorithm:

①  $t \leftarrow 1$

② Randomly choose  $k$  means  $\mu_1^{(1)}, \mu_2^{(1)}, \dots, \mu_k^{(1)}$

③ While not converged:

3a Assign each  $\mathbf{x}^{(i)} \in \mathcal{D}$  to the closest cluster:

$$\mathcal{D}_j^{(t)} = \left\{ \mathbf{x}^{(i)} : \|\mathbf{x}^{(i)} - \mu_j^{(t)}\|^2 \leq \|\mathbf{x}^{(i)} - \mu_{j^*}^{(t)}\|^2; \forall j^* = 1, 2, \dots, k; \mathbf{x}^{(i)} \in \mathcal{D} \right\}$$

3b Update cluster centroids  $\mu_j$ :

$$\mu_j^{(t+1)} = \frac{1}{|\mathcal{D}_j^{(t)}|} \sum_{\mathbf{x}^{(i)} \in \mathcal{D}_j^{(t)}} \mathbf{x}^{(i)} \quad \text{then update } t: \quad t \leftarrow t + 1$$

## *k*-Means Algorithm (Ctd.)

- The algorithm might need some iterations until the result is satisfactory
- **Caveat:** The algorithm might get stuck in local optima  
⇒ several restarts

# Image Compression

Original image

Compressed image

## *k*-Means Issues

- The algorithm assumes that all clusters are **spherical** ( $\neq$  **affinity-based clustering**)
- It does not have a notion of **outliers** (unlike DBSCAN)
- What is the correct value for  $k$ ?  $\Rightarrow$  **Elbow-method:**
  - Measure sum of squared distances from data points to cluster centers (inertia)
  - Record results for different values for  $k$  and plot them
  - Search for the 'elbow point'

# Elbow Method

Section:  
**Hierarchical Clustering**

# Agglomerative Clustering Algorithm

- 1 Start with one cluster for each instance:  $C = \{\{\mathbf{x}^{(i)}\} : \mathbf{x}^{(i)} \in \mathcal{D}\}$
- 2 Compute distance  $d(C_i, C_j)$  between all pairs of clusters  $C_i, C_j$
- 3 Join clusters  $C_i$  and  $C_j$  with minimum distance into a new cluster  $C_p$ :

$$C_p = \{C_i, C_j\}$$

$$C = (C \setminus \{C_i, C_j\}) \cup \{C_p\}$$

- 4 Compute distances between  $C_p$  and all other clusters in  $C$
- 5 If  $|C| > 1$ , goto 3

# Agglomerative Clustering: Example

## Agglomerative Clustering: Example (Ctd.)

## Agglomerative Clustering: Example (Ctd.)

# Agglomerative Clustering: Example (Ctd.)

## Agglomerative Clustering: Example (Ctd.)

This is a  
**dendrogram**

# Single Linkage

- How to compute the distance between two clusters  $C_1$  and  $C_2$ ?
- **Single linkage:**

$$d(C_1, C_2) = \min\{d(\mathbf{x}^{(i)}, \mathbf{x}^{(j)}) : \mathbf{x}^{(i)} \in C_1, \mathbf{x}^{(j)} \in C_2\}$$

# Complete Linkage

- How to compute the distance between two clusters  $C_1$  and  $C_2$ ?
- **Complete linkage:**

$$d(C_1, C_2) = \max\{d(\mathbf{x}^{(i)}, \mathbf{x}^{(j)}) : \mathbf{x}^{(i)} \in C_1, \mathbf{x}^{(j)} \in C_2\}$$

Section:  
**Spectral Clustering**

# Spectral Clustering

- Remember the disadvantage of  $k$ -Means? (spherical clusters)
- How can we cluster data without this assumption?

⇒ **Affinity-based clustering**

**Affinity-based clustering** assumes **no shape** of the resulting clusters. It is based on the **connectedness of the data points**.

- Spectral clustering is affinity-based
- Whenever you hear '*spectral*': It has something to do with eigen-vectors

## Example Data Set

What would be  
the result of *k*-Means?

# A short Introduction to Graphs

- A graph  $\mathcal{G}$  is a tuple  $\mathcal{G} = (\mathcal{V}, \mathcal{E})$
- $\mathcal{V} = \{v_1, v_2, \dots, v_n\}$  is the set of  $n$  vertices (nodes)
- $\mathcal{E} \subseteq \mathcal{V} \times \mathcal{V}$  the set of edges (connections between nodes)
- **Adjacency matrix  $A$** 
  - $A_{ij} = 1$ , iff  $(v_i, v_j) \in \mathcal{E}$  ( $v_i$  is a neighbor of  $v_j$ )
  - $A$  is symmetric for undirected graphs, i. e.  $A_{ij} = A_{ji}$
- The **degree matrix  $D$**   $D = \text{diag}(d_1, d_2, \dots, d_n)$  is a matrix of node degrees

$$d_i = \sum_{j=1}^n A_{ij}$$

## A short Introduction to Graphs (Ctd.)

- For graph analysis it is often useful to compute the **graph Laplacian** matrix:

$$L = D - A$$

- Example:

## Example: Computation of $A$ , $D$ and $L$

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 & 1 & 0 \\ 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \end{bmatrix}$$

$$D = \begin{bmatrix} 2 & 0 & 0 & 0 & 0 & 0 \\ 0 & 3 & 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 3 & 0 & 0 \\ 0 & 0 & 0 & 0 & 3 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

$$L = \begin{bmatrix} 2 & -1 & 0 & 0 & -1 & 0 \\ -1 & 3 & -1 & 0 & -1 & 0 \\ 0 & -1 & 2 & -1 & 0 & 0 \\ 0 & 0 & -1 & 3 & -1 & -1 \\ -1 & -1 & 0 & -1 & 3 & 0 \\ 0 & 0 & 0 & -1 & 0 & 1 \end{bmatrix}$$

# How to get the Graph for the Data Set?

- There are at least two possibilities:
  - ①  **$\varepsilon$ -neighborhood graph**
    - Connect all instances whose pairwise distances are smaller than  $\varepsilon$
    - **Problem:** How to choose  $\varepsilon$ ?
  - ②  **$k$ -nearest neighbor graph**
    - Connect instance  $\mathbf{x}^{(i)}$  with instance  $\mathbf{x}^{(j)}$ , if  $\mathbf{x}^{(j)}$  is among the  $k$  nearest neighbors of  $\mathbf{x}^{(i)}$
    - Attention: This definition leads to a directed graph (**Why?**)  
 $\Rightarrow$  Can be ignored
    - **Problem:** How to choose  $k$ ?
- Both approaches are used in practice

# Spectral Clustering Algorithm

- Input:  $\mathcal{D} = \{\mathbf{x}^{(1)}, \mathbf{x}^{(2)}, \dots, \mathbf{x}^{(n)}\} \in \mathbb{R}^{n \times m}$ , number of clusters  $k$
- Algorithm:
  - ① Construct a similarity graph (adjacency matrix  $\mathbf{A}$  and degree matrix  $\mathbf{D}$ )
  - ② Compute the graph Laplacian matrix  $\mathbf{L} = \mathbf{D} - \mathbf{A}$
  - ③ Perform **eigen-decomposition** on  $\mathbf{L}$  (to obtain the eigen-vectors  $\mathbf{Q}$ )

$$\mathbf{L} = \mathbf{Q}\mathbf{\Lambda}\mathbf{Q}^{-1}$$

- ④ Apply  $k$ -Means to the rows of matrix  $\mathbf{Q}$  to obtain the clusters  $\{C_1, C_2, \dots, C_k\}$

Section:  
**Wrap-Up**

# Summary

- Clustering belongs to the category of **unsupervised learning**
- With clustering we try to find **structure in the data**
- Different algorithms make **different assumptions** about the resulting clusters
- **Clustering Strategies:**
  - EM-based clustering (e. g. *k*-Means)
  - Hierarchical clustering
  - Affinity-based clustering (e. g. spectral clustering, DBSCAN)

# Self-Test Questions

- 1 What is clustering?
- 2 What is the definition of a cluster. Which properties should it have?
- 3 Describe the general procedure of *k*-Means. What are disadvantages?
- 4 What is a dendrogram?
- 5 How do we obtain the graphs for spectral clustering?
- 6 What is affinity-based clustering? How does it differ from *k*-Means?
- 7 How to calculate the graph Laplacian matrix?
